Image Compression

- Q) Consider the simple 3×3 , 8 bit image as (3, 4, 7) (3, 4, 7) (3, 4, 7)
- Suppose you want to compress the image using a loss less Lempel-Ziv-Welch(LZW) fixed length coding algo.
- Generate your new code book using 9 bits and illustrate your steps LZW encoding process.
 - What kind of redundancy of image data it reduces in your encoding process?
 - Any compression achieved by employing LZW?
Proof it.

Ans:

i

For 8bit image codebook will be 9bit.

In my LZW coding process it reduces spatial data redundancy.

It assigns fixed-length code words to variable length sequence of source symbols.

Before compression,

Total matrix value = $3 \times 3 = 9$

Original image size = $9 \times 8 \text{ bit} = 72 \text{ bit}$

After Compression

Total Encoded output = $6 \times 6 = 36$

Each encoded output $\rightarrow 6 \text{ bit}$

Compressed image size = $9 \times 6 = 54 \text{ bit}$

Compression Ratio = $\frac{72}{54} = 1.33 : 1$

Yes, compression achieved.

② Why image compression needed?

* Data stored at low storage

* Data transmission at minimum cost

① How many and what types of data redundancy are -

3 types:

* Coding redundancy \rightarrow most 2D intensity array contain more bits than are needed to represent intensity.

* Spatial and temporal redundancy \rightarrow Pixels of 2D intensity arrays are correlated spatially and video sequence are temporally correlated.

Irrelevant information: most 2D intensity arrays contain information that is ignored by the human visual system.

- (iii) A 512×512 8 bit image with 5.3 bits/pixel entropy is to be Huffman Coding. What is the maximum compression that can be expected?

$$\Rightarrow \text{Entropy} = 5.3 \text{ bits/pixel}$$

Means minimum 5.3 bits are required to represent a pixel without losing any data/info.

$$\text{Compression ratio} = \frac{512 \times 512 \times 8}{512 \times 512 \times 5.3}$$

This is the maximum compression ratio that can be expected.

- (3) 3×3 , 8 bit image

- ① Illustrate your Huffman encoding process for image.

Ans: Symbol — Pixel value — Probability ($3 \times 3 = 9$)

$$a_1 \quad 11 \quad \frac{1}{9} = 0.33$$

$$a_2 \quad 14 \quad \frac{2}{9} = 0.22$$

total count
total number

$$a_3 \quad 16 \quad \frac{3}{9} = 0.33$$

$$a_4 \quad 18 \quad \frac{1}{9} = 0.11$$

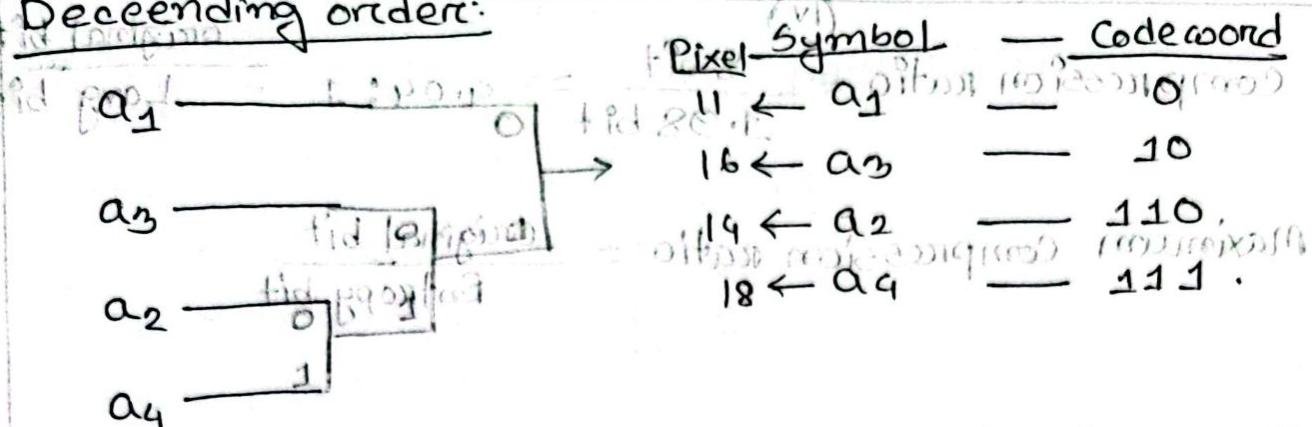

Sort the symbols in ascending order of probability.

Priority code is also a representation of binary voltage.

For example when binary voltage is 0.5 then priority code is 0.5.

• between 0 and 1.

Decreasing order:

→ Appr. 10x9 8xp (1)

(1)

Compute Entropy of the above image.

$$\text{Ans} \rightarrow \text{Entropy} = \sum_{k=1}^{L-1} -P_k(r_k) \log_2(P_k(r_k)) \quad L = \# \text{ of intensity gray level}$$

$$\text{Entropy} = -(0.33) \log_2(0.33) + -(0.22) \log_2(0.22) + -(0.33) \log_2(0.33) + -(0.11) \log_2(0.11)$$

Intensity or gray level value k

$= 1.758 \text{ bits/pixel}$

→ Appr. 10x9 histogram of input image (Probability of r_k)

What kind of redundancy of image data it reduce in your encoding process? is it loss less?

Ans It reduce the coding redundancy applying variable length code.

Average bit required per symbol,

$$L_{avg} = \sum_{i=0}^L L_i P_i = \text{Probability} \times \text{number of bit}$$

$$= (0.33) \times \frac{1}{16} + (0.22) \times \frac{3}{16} + (0.33) \times \frac{2}{16} + (0.11) \times \frac{3}{16}$$

$$= 1.98 \text{ bit/pixel}$$

$H < L_{avg} \rightarrow$ so this compression is lossless.

$$\text{Compression ratio} = \frac{8 \text{ bit}}{1.98 \text{ bit}} = 4.04 : 1 \quad \frac{\text{original bit}}{\text{avg bit}}$$

$$\text{Maximum Compression ratio} = \frac{\text{original bit}}{\text{Entropy bit}}$$

④ 4x8 pixel image →

21	21	21	95	169	243	243	243

- ① Compute the entropy.
- ② Calculate the representative Huffman Codes for each pixel.
- ③ What is the compression ratio achieved by employing Huffman Coding instead of 8bit fixed length coding?

④ calculate the relative data redundancy of the given 8bit image.

⑤ Compute the effectiveness of the huffman coding.

$$\text{Entropy} = \sum_{k=1}^{L-1} -P_k(\pi_k) \log_2(P_k(\pi_k)) \quad \text{① Huffman symbol - pixel - Probability}$$

$$\text{total pixel} = 4 \times 8 = 32 \quad \begin{array}{l} a_1 = 21 \rightarrow 12/32 = 0.375 \\ a_2 = 95 \rightarrow 4/32 = 0.125 \\ a_3 = 169 \rightarrow 4/32 = 0.125 \\ a_4 = 243 \rightarrow 12/32 = 0.375 \end{array}$$

$$\text{Entropy} = -[(0.375) \log_2(0.375) + (0.125) \log_2(0.125) + (0.125) \log_2(0.125) + (0.375) \log_2(0.375)] = 1.841$$

fixed 8bit =

encoded dimensionless unit dd < 8bit > H

5x5

18	16	16	19	12
11	11	12	14	12
11	14	12	12	14
12	16	16	17	17
17	12	11	14	11

① Derive the equation to calculate Entropy of an image from the information theory to understand the optimum required bit to represent image information.

Ans: Information Theory: If we have a source consider the pixel intensity are as random events then the intensity histogram is approximation of the probabilities of

whence,

$$H = \sum_{k=1}^{L-1} -P_{\pi}(r_k) \log_2 P_{\pi}(r_k) \quad (i) \quad L = \# \text{ of intensity or gray levels}$$

$r_k = \text{Input image intensity / gray level}$

$P_{\pi}(r_k) = \text{Normalized histogram}$

Entropy is the measurement of the average information in an image. So it is not possible to encode input image with fewer than H bits/pixel.

prob. $\leq 2^{-H}$
threshold

⑥ ①

Compute Suppose (3×3) of 3 bit image is compressed by lossy compression technique, after de-compression, all the pixels value increased by 2. Calculate the Root-mean square Error as fidelity criterion.

② Compute the Golomb code for $G_{4,2}(g)$

Given image

①

Each pixel of $f'(x,y)$ increased by 2.

$f(x,y) + 2 = f'(x,y)$
$\begin{array}{ c c c } \hline 1 & 4 & 3 \\ \hline 2 & 3 & 4 \\ \hline 2 & 4 & 5 \\ \hline \end{array} \quad \begin{array}{ c c c } \hline 3 & 6 & 5 \\ \hline 4 & 5 & 6 \\ \hline 4 & 6 & 7 \\ \hline \end{array}$

$$\text{Row} = m = 3$$

$$\text{col} = N = 3$$

$$e_{\text{rms}} = \sqrt{\frac{1}{mN} \sum_{x=0}^{m-1} \sum_{y=0}^{N-1} [f(x,y) - f'(x,y)]^2}$$

$$= \sqrt{\frac{1}{3 \times 3} (2^2) \times 9}$$

$$= 2$$

যেখানে প্রতিটি 2 বাটুর অংশ হচ্ছে 50
প্রতিরুপ difference 2 হবে and
অন্য square power শিখবে এটাকে

$$DE = \text{Root mean square} \quad E = \left[\frac{1}{n} \right] = (2)^{1/2} = \sqrt{2}$$

$$\text{Golomb Coding: } G_m(n) = G_{m,2}(g) \quad \text{where } g = \frac{n}{m} \quad \text{and } m = \text{divisor} = 4.$$

$$\text{Step 1: } \text{Floor}(\frac{n}{m}) = \text{Floor}(\frac{9}{4}) = 2.25 \approx 2 = q$$

$$\text{so unary code} = 110.$$

Step-2: $k = \lceil \log_2 m \rceil$, $c = 2^k - m$; $r = n \bmod m$

and compute truncated remainder r' such that
 $r \leq r' < c$

$$r' = \begin{cases} r \text{ truncated to } k-1 \text{ bit if } 0 \leq r < c \\ r+c \text{ truncated to } k \text{ bit otherwise.} \end{cases}$$

Now, $n = 2 + (r \cdot 2^k)$

$$k = \lceil \log_2(4) \rceil = 2 ; c = 2^2 - 4 = 0 ; r = 9 \bmod 4 = 1$$

$0 \leq r < c$ is not accepted.

$$r' = r+c = 1+0=1 = 01$$

~~truncate 1 bit from k bit~~

Step-3: Concatenated result from step 1 and 2.

110 01

Another: $G_4(7)$, $n=7$, $m=4$

$$\textcircled{1} q = G_4(7) = \lfloor \frac{7}{4} \rfloor = 1 \quad \text{Unary code} = 10$$

$$\textcircled{2} k = \lceil \log_2 4 \rceil = 2 ; c = 2^k - m = 2^2 - 4 = 0 ; r = n \bmod m = 7 \bmod 4$$

$$r' = r+c = 3 = 11 \rightarrow \text{Binary}$$

$$\textcircled{3} 10\ 11 \rightarrow \text{concatenated } \textcircled{1}\ \textcircled{2}.$$

⑥ Consider the table-I below that represents the five symbol source with probabilities and initial subintervals. What is the Arithmetic code for the sequence $a_1 a_4 a_3 a_4 a_2 a_5$?

$a_1 \ a_4 \ a_3 \ a_4 \ a_2 \ a_5$?

* যদি $CDF \rightarrow PDF$ value দিয়ে calculate করা হয়ে গেলে

$$s_k = (L-1) \times CDF$$

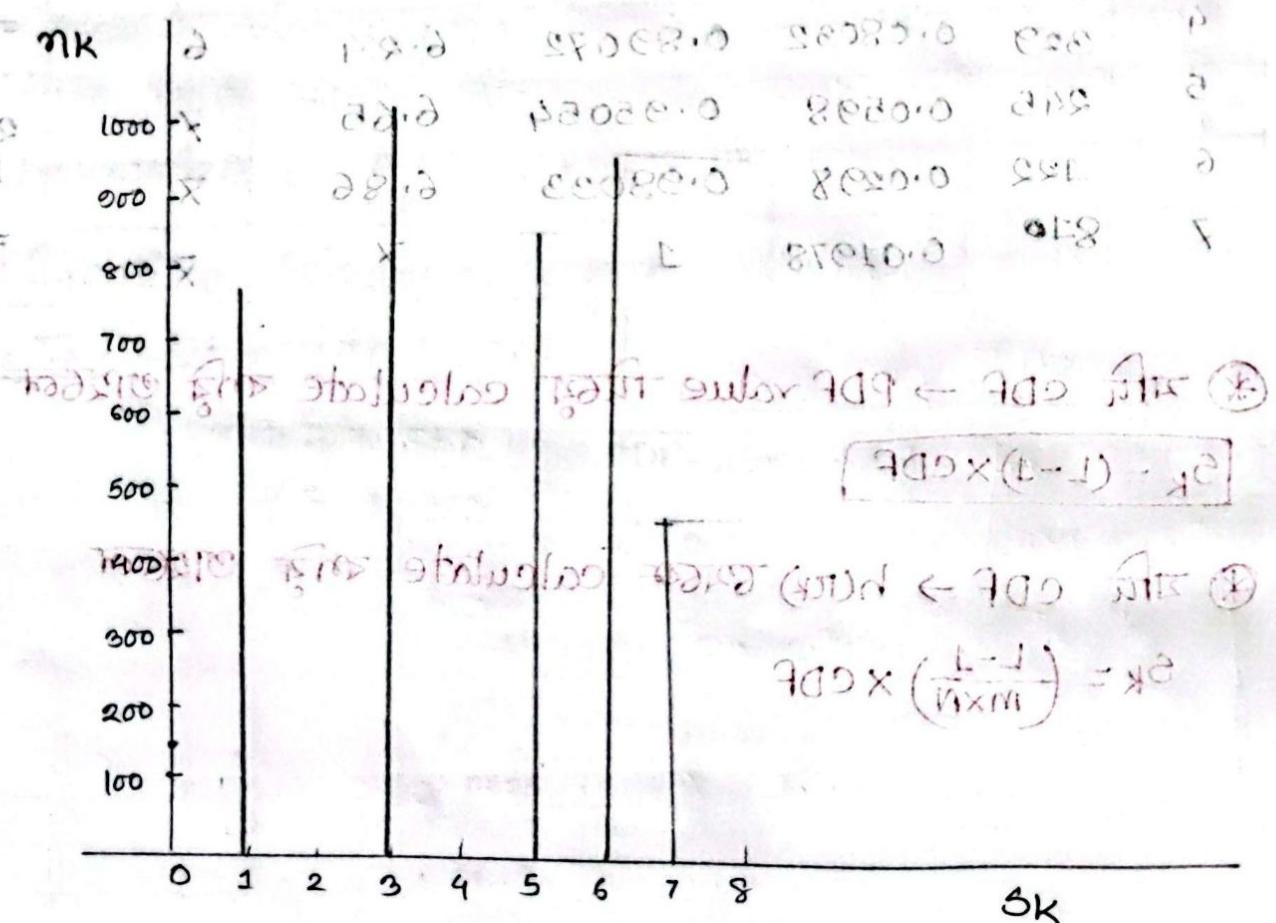

* যদি $CDF \rightarrow h(r_k)$ দিয়ে calculate করা হয়ে গেলে

$$s_k = \left(\frac{L-1}{m \times N} \right) \times CDF$$

here (first) $G = \{1, 2\}$ $\theta = 1$, total pos. = 2

Graph - 1: Normalized Graph.

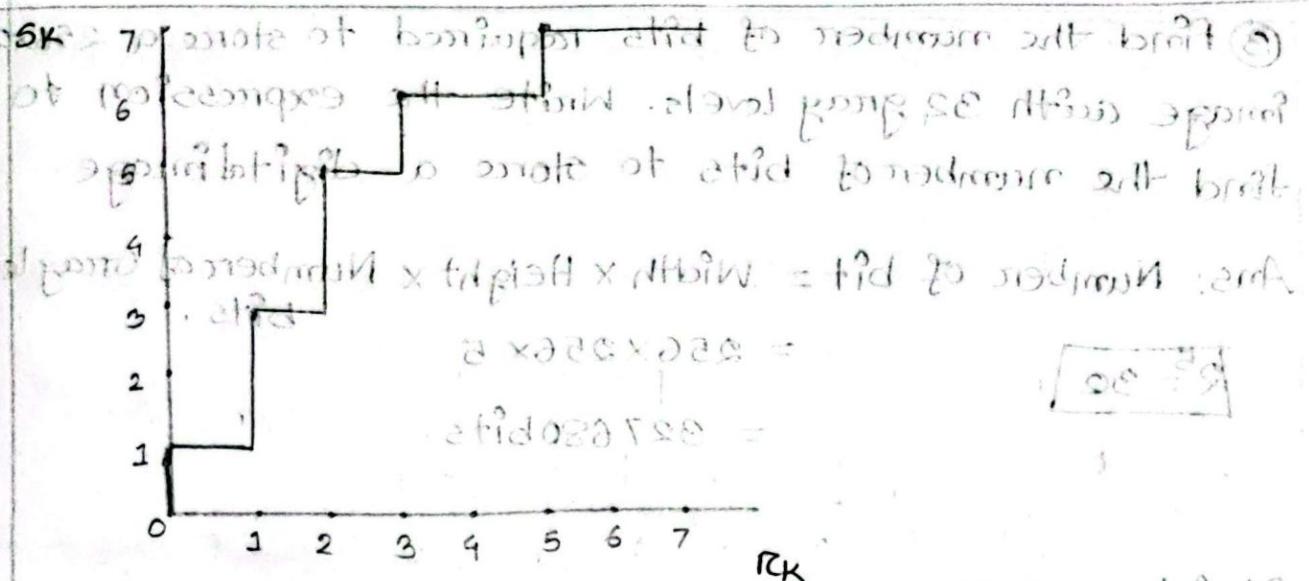

$$G_k = (T-1) \times GDE$$

all $GDE \rightarrow GDE$ average value

$$G_k = \left(\frac{L}{m \times n} \right) \times GDE$$

Graph 2: Equalization.

(b) 8 - mark question

Graph-3: Transition graph

(iii) Show that the mapping of the new gray level values into number of pixels.

Ans 50, Gray level \rightarrow # of pixels

Gray level	# of pixels
0	790
1	790
2	0
3	1023
4	0
5	850
6	656 + 329
7	245 + 122 + 81

Gray level	No of pixel	5K
0	790	1
1	1023	3
2	850	5
3	656	6
4	329	6
5	245	7
6	122	7
7	81	7

$$= 4096 \times (1 + 3 + 5 + 6 + 6 + 7 + 7 + 7) = 4096 \times 45 = 184320$$

$$= 184320 \times (0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001) = 184320 \times 0.0008 = 147456$$

$$= 147456 \times (0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001 + 0.0001) = 147456 \times 0.0008 = 1179648$$

$$= (1 + 3 + 5 + 6 + 6 + 7 + 7 + 7) \times 0.0008 = 45 \times 0.0008 = 0.036$$

③ Find the number of bits required to store a 256×256 image with 32 gray levels. Write the expression to find the number of bits to store a digital image.

Ans: Number of bit = Width \times Height \times Number of Gray level bits.

$$R^5 = 32$$

$$= 256 \times 256 \times 5$$

$$= 327680 \text{ bits.}$$

Decipher - 3(f)

(i) Suppose you have a 3×3 image with values as

~~dimensions~~ $[2, 5, 8, 5, 1, 3, 4, 7, 2]$ How can you smooth this image using an average filter of size 3×3 and zero padding? Show your filtered output image with detailed calculations.

Ans: Main image with zero padding

	0.00	0.00	0.00

$$T_{22} \rightarrow 2(L - k - \infty)^{\frac{1}{2}} - (L + k_2 \infty)^{\frac{1}{2}} =$$

② median \rightarrow 0 1 1 2 3 3 4 8 T₂₃ \rightarrow 2

③ median \rightarrow 0 0 1 2 2 3 3 5 7 11 T₃₂ \rightarrow 13

medium → 0 1 22 ③ 478 Tac → 3

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 2 & 2 \\ 0 & 3 & 3 \\ 0 & 0 & 0 \end{bmatrix}$$

• que figura o no matiz.

(iii) Derive a positive Laplacian filter mask to enhance an image in a single filtering operation.

$$\Rightarrow \text{Positive Laplacian} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix}$$

When we apply Laplacian filter the output image is just about the edges of original picture. So to get enhanced picture by using Laplacian filter we have to add (for negative) or subtract (for positive lap) with from the original image.

But these two step can be done in one step.

$$\begin{aligned} \text{Enhanced image, } g(x,y) &= f(x,y) + \nabla^2 f \\ &= f(x,y) - [f(x+1,y) + f(x-1,y) \\ &\quad + f(x,y+1) + f(x,y-1) - 4f(x,y)] \\ &= f(x,y) - f(x+1,y) - f(x-1,y) \\ &\quad - f(x,y+1) - f(x,y-1) + 4f(x,y) \\ &= 5f(x,y) - f(x+1,y) - f(x-1,y) \\ &\quad - f(x,y+1) - f(x,y-1) \end{aligned}$$

$$\begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & -1 & 0 \\ -1 & 5 & -1 \\ 0 & -1 & 0 \end{bmatrix}$$

= modified filter

So now we can enhance an image with modified filter in a single step.

* original picture $\xrightarrow{\text{filter}} \text{no change}$

original picture $\xrightarrow{\text{filter}} \text{Total picture will shift left by 1 pixel}$

original $\xrightarrow{\left(\begin{array}{ccc} 0 & 0 & 0 \\ 0 & 20 & 0 \\ 0 & 0 & 0 \end{array} - \frac{1}{9} \left| \begin{array}{ccc} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{array} \right| \right)}$ Sharpening filter
 Emphasize difference with local average.

Gy

Gx

④ What is the objective of sharpening image? 3bit image
 of size 5 by 5 in the square. calculate the gradient
 magnitude and angle using Sobel mask at the
 highlighted center pixel.

Ans: Fixing Edges & Edges

→ Remove Blurring from image

→ Highlight edges.

→ Useful for emphasizing transitions in image intensity.

0	2	6	7	3	5
1	1	6	4	2	4
4	5	2	7	4	5
1	2	6	0	3	6

Using Sobel: Gx:

1	6	9
5	2	7
2	6	0

-1	0	1
-2	0	2
-1	0	1

Result: Gx = -1 + 0 + 4 - (-2) + 0 + 14 - 2 + 0 + 0 = 5

Result: Gy = -1 + 12 - 4 + 0 + 0 + 2 + 12 + 0 = -3

Gy:

$$\begin{vmatrix} 1 & 6 & 9 \\ 5 & 2 & 7 \\ 2 & 6 & 0 \end{vmatrix} \times \begin{vmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{vmatrix} = \begin{vmatrix} -1 & 12 & -4 \\ 0 & 0 & 0 \\ 2 & 12 & 0 \end{vmatrix}$$

$$Gy = -1 + 12 - 4 + 0 + 0 + 2 + 12 + 0 = -3$$

Gradient magnitude, $G = \sqrt{|G_x|^2 + |G_y|^2} = \sqrt{5^2 + (-3)^2} = \sqrt{34} = 5.8$

$$\theta = \tan^{-1} \frac{G_y}{G_x} = \tan^{-1} \frac{-3}{5} = -30.96^\circ$$

$$G = 5.8$$

1	-1	1

B

⑤ Define the Bit Plane slicing method. What are the 3 main goals of bit plane slicing? Consider

$I = (150, 60), (60, 210)$ as a 2×2 image with 8 bit gray values.

(i) Give 8 bit planes of I

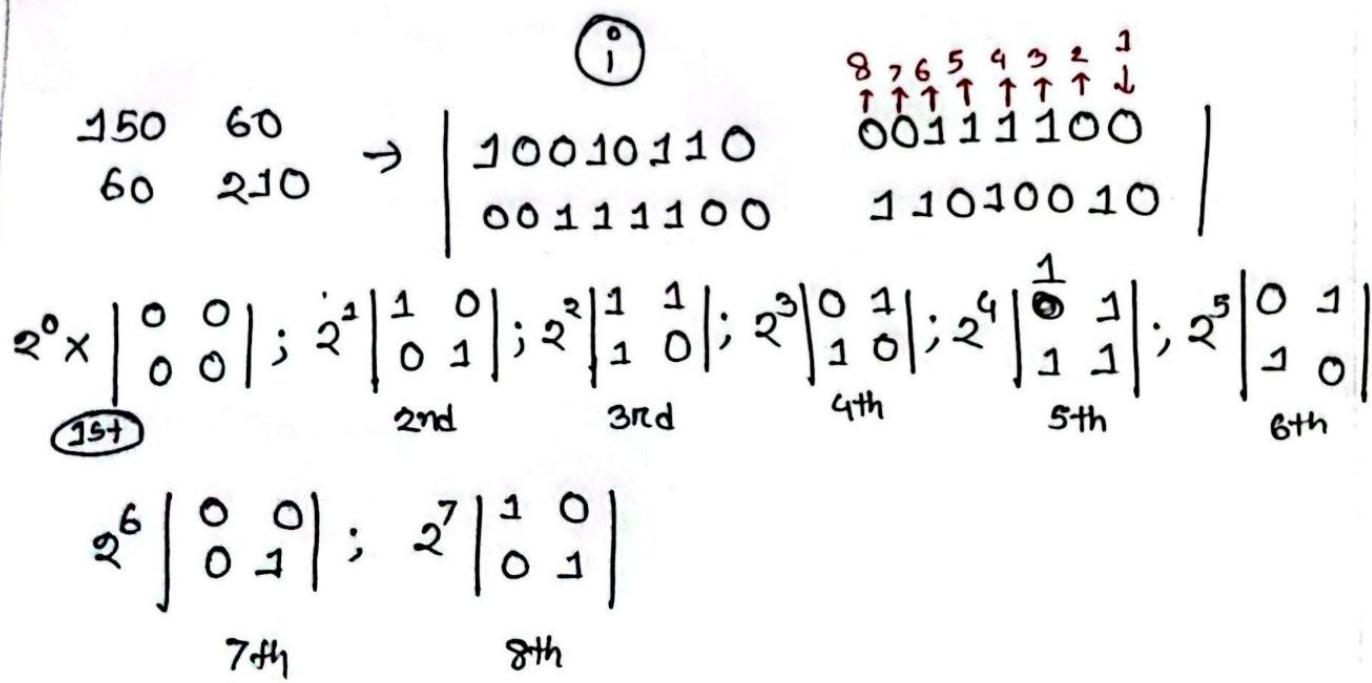

(ii) Determine the reconstructed image using bit planes

Ans: Bit plane slicing is a method of representing an image with one or more bits of the byte used for each pixel.

One can only use MSB to represent the pixel which reduce the original gray level to a binary image.

3 main goals:

1. Converting Gray level image to binary image.
2. Representing image with fewer bits and that's why the image smaller size.
3. Enhancing image by focusing main characteristics.

Reconstructed image using bit plane 8 and 7

$$2^7 \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} + 2^6 \begin{vmatrix} 0 & 0 \\ 0 & 1 \end{vmatrix} = \begin{vmatrix} 128 & 0 \\ 0 & 128 \end{vmatrix} + \begin{vmatrix} 0 & 64 \\ 0 & 64 \end{vmatrix} = \begin{vmatrix} 128 & 0 \\ 0 & 192 \end{vmatrix}$$

Neighbors less than or equal to 128 are set to white
Neighbors greater than 128 are set to black

• Reconstruction of image using bit plane 7
• Reconstruction of image using bit plane 6

$$\begin{matrix} \text{bit 8} & \text{bit 7} \\ \text{bit 6} & \text{bit 5} \\ \text{bit 4} & \text{bit 3} \\ \text{bit 2} & \text{bit 1} \\ \text{bit 0} & \text{bit 1} \end{matrix} \quad \text{bit 0} \quad \text{bit 1} \quad \text{bit 2} \quad \text{bit 3} \quad \text{bit 4} \quad \text{bit 5} \quad \text{bit 6} \quad \text{bit 7}$$
